HWK API

Create a website for searching for information about the country. Example:
http://booksarebetter.surge.sh/

Pages:

1. Login page (only UI)
    a. Login and Password inputs (both are validated, password - min 5 characters)
2. All countries
    a. Allow searching for a country (validated - only string)
    b. Allow to add/remove the country to/from favorites
3. Favorites
    a. List of the countries that the user added to favorites
    b. Allow to add/remove the country to/from favorites

Requirement:

➔ Your app should allow the searching country then show a list of countries and then allow the user to get info about each country. API: https://restcountries.eu/

➔ The web site should be **responsive**

➔ All code should be pushed to **GitHub** and commit messages should be as **descriptive** as possible

➔ ****** Save all possible info in **local storage** so app won't lose information when you refresh the page

➔ ****** Publish your site using **GitHub pages**
